#### **DETAILED ACTION**

### Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-3, 5-16, 22-23, 25, 28-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Boling et al. (US 6,226,510 B1, hereinafter "Boling") in view of Loomis et al. (US 5,625,668, hereinafter "Loomis"), and further in view of Markowitz et al. (US 6,295,346, hereinafter "Markowitz").

Boling discloses a method for distributed notification, the method comprising:

receiving a location signal at a base station (the private emergency response service can be considered as a base station which receives a location signal and identity information from the user's phone/pager 10; col. 3, line 65 – col. 4, line 28; col. 5, lines 1-4; col. 6, lines 19-39);

storing a contact profile (the private emergency response service maintains a list of persons to contact; col. 4, lines 1-4);

providing to each of the plurality of contacts a respective notification message (the private emergency response service forwards the emergency caller's location and identify information to each person on the list; col. 4, lines 4-11).

Boling differs from claims 1-3, 5-16, 22-26, 28-30 in that it does not specify determining from the location signal a street address. However, Loomis teaches the desirability of converting latitude and longitude data into street address format using indexed databases (col. 2, lines 30-

Art Unit: 2643

59) such that it would have been obvious to an artisan of ordinary skill to incorporate such conversion of location data, as taught by Loomis, within the method of Boling in order to provide location information in a format which is more helpful to the recipient.

Boling further differs from the claims in that a notification message is provided to a public emergency response service by a separate call from the user's phone/pager rather than from the base station (private emergency response service)(col. 4, lines 26-30). However, Markowitz teaches the desirability of having the base station (private emergency response service is outcall module 190 in Figure 1) place a phone call to the public emergency service (emergency service provider) along with phone calls to each of a plurality of contacts (col. 3, line 63 – col. 4, line 5) so that only a single phone call from the user to the base station (private response service) is needed to establish communication with a plurality of contacts as well as the public emergency response service. It would have been obvious to an artisan of ordinary skill to modify the method of Boling by having the private response service contact the public emergency response service as well as each of a plurality of contacts, as taught by Markowitz, so that only one phone call from the user is needed to send the caller's identity and location coordinates (notification message) to the public emergency service as well as to each person on the contact list.

Regarding claim 3, in Boling, location data is received from GPS receiver 64 (col. 6, lines 22-30; col. 10, lines 16-25).

Regarding claims 5-6, in Boling, location information includes longitude/latitude coordinates (col. 4, lines 20-21; col. 10, lines 19-24).

Application/Control Number: 09/965,984

Art Unit: 2643

Regarding claims 7-9, Markowitz teaches the desirability of communicating an emergency notification message to a predefined set of parties in the form of an e-mail message in lieu of a voice message (col. 7, lines 34-45, 51-53) such that it would have been obvious to an artisan of ordinary skill to incorporate such use of e-mail, as taught by Markowitz, within the method of Boling and Loomis in order to allow for the option of e-mail notification.

Regarding claims 8-9, Markowitz provides for using a template (col. 7, lines 45-50).

Regarding claims 10-12, 25, Markowitz teaches the desirability of communicating an emergency notification message by synthesized voice (col. 4, lines 6-45) such that it would have been obvious to an artisan of ordinary skill to incorporate such use of a synthesized voice message, as taught by Markowitz, within the method of Boling and Loomis when notifying each contact over the telephone system.

Regarding claims 11-12, Markowitz uses a voice template to form a notification message (col. 4, lines 10-45).

Regarding claim 13,in Boling, the caller's identity is received from the caller's phone/pager (col. 4, lines 6-7).

Regarding claim 14, in Markowitz, information regarding the caller's identity is retrieved from subscriber database 120 (col. 3, lines 33-38).

Regarding claims 15-16, the triggering event is the activation of the emergency button 20 (col. 3, lines 55-64; col. 6, lines 52-56).

3. Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of Boling, Loomis and Markowitz, and further in view of McCurdy (US 6,340,928 B1).

The combination of Boling, Loomis and Markowitz differs from claim 17 in that it does not provide for the detection of an automobile collision. However, McCurdy teaches the well known use of collision detection (vehicle crash sensing system 40) as a triggering event to automatically placing an emergency call (Abstract) such that it would have been obvious to an artisan of ordinary skill to incorporate such collision detection, as taught by McCurdy, within the method of Boling, Loomis and Markowitz in order to automatically report an emergency from a vehicle in response to a collision in case the user is not physically able to activate the emergency button.

4. Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of Boling, Loomis and Markowitz, and further in view of Pons et al. (US 5,805,670, hereinafter "Pons").

The combination of Boling, Loomis and Markowitz differs from claim 18 in that it does not specify the notification message containing the status of the event. However, Pons teaches the desirability of including ongoing incident details within the notification message (col. 1, lines 45-48, 58-62; col. 11, lines 14-16) such that it would have been obvious to an artisan of ordinary skill to incorporate such reporting of event status, as taught by Pons, within the method of Boling, Loomis and Markowitz so that other can be apprised of the latest state of events, such as the destination medical treatment facility to which the 911 caller is being transported.

5. Claims 24 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of Boling and Loomis, and further in view of Tsumpes (US 6,442,241 B1).

The combination of Boling, Loomis and Markowitz differs from claims 24 and 26 in that it does not specify the contact profile as including a contact type associated with each contact or

Application/Control Number: 09/965,984

Art Unit: 2643

contact via Internet connection. However, Tsumpes teaches the desirability of communicating an emergency notification message to a list of contacts in a variety of ways, such as voice, pager, voice mail, fax and e-mail (which takes place over the Internet), with the subscriber account record indicating the formats in which a message is to be communicated for each contact (Abstract; Figure 4; col. 6, lines 10-23) such that it would have been obvious to an artisan of ordinary skill to incorporate such use of a variety formats, as taught by Tsumpes, within the method of Boling, Loomis and Markowitz in order to provide options as to how each contact is to be notified.

## Response to Arguments

6. Applicant's arguments filed September 1, 2004 have been fully considered but they are not persuasive.

Applicant argues that "Markowitz teaches that the emergency service provider is <u>actually</u> <u>connected</u> to the calling party" whereas "claim 1 recites that a notification message is sent to the emergency service provider rather than actually connecting the calling party and the emergency service provider."

However, the rejection of claim 1 was based on a combination of references, namely, Boling in view of Loomis, and further in view of Markowitz. It is the Boling reference which was relied upon for teaching the sending of a notification message (caller's identity and location coordinates) to a list of person on a contact list (col. 4, lines 4-11) as well as to an emergency service (location coordinates are sent to the public emergency response service; col. 10, lines 23-25). Boling differs from claim 1 in that the base station (private emergency response service) is not used to send the message to the public emergency response service. Markowitz was relied

upon for its teaching of using the base station (outcall module 190) to contact the public emergency response service as well as each of a plurality of contacts (col. 3, line 63 – col. 4, line 5).

#### Conclusion

7. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Stella L. Woo whose telephone number is (571) 272-7512. The examiner can normally be reached on Monday-Tuesday, Thursday-Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Curtis Kuntz can be reached on (571) 272-7499. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
